project as a dummy

“Losing Tomorrow” is a diary-like photo project that began after the end of the exhibition *“Thank You for Everything.”* It’s an attempt to observe and live my life — but no longer focused solely on loneliness. These are moments captured over the span of three years.

I woke up once again at 3:30 AM. Turned over, adjusted my pillow, pulled the blanket up to my neck, gently closed my eyes, nearly drifting off. *Boom.* Worries about life–work– relationship–the-world came crashing in. In an instant, my pulse was racing, body sweating, and mind wide awake. For the next three hours, I lay there, trying to numb myself with videos, podcasts, endless scrolling. Desperate not to feel, not to think. Just to be, and fall asleep.

Anxiety burns through my chest, and eventually I do fall back asleep. Upon waking, I realize — nothing is quite as urgent as it felt. We’ll all survive. But the body and mind feel exhausted and ruined. The next day — the one I had gone to bed for — is lost.

The photos are taken in all kinds of states — quiet mornings at home or away, joyful moments with friends, hazy scenes while happily drunk, or deep in a hole trying to neutralize the feeling by capturing it. Photographing pain that pulls me out of the moment, reminds me it’s all in the mind — and offers relief during good times.

The series places special emphasis on twin works, diptychs. The pairs have formed based on emotion, visuals, or shared location. A separate type of diptych captures a moment both naturally and with flash — pulling the photos out of time and place. Shooting on film limits how quickly one can capture time. The flashless diptych becomes a forced shift in time, movement — the same time and place, caught in a different time and place.

Losing Tomorrow — the nature of time. Quiet domestic shots, loneliness in empty airports, alternating with the precision of flash and the soft drift of blur. How time exists, how it halts and flows.
